

# Amur Maple

zhiigmewanzh

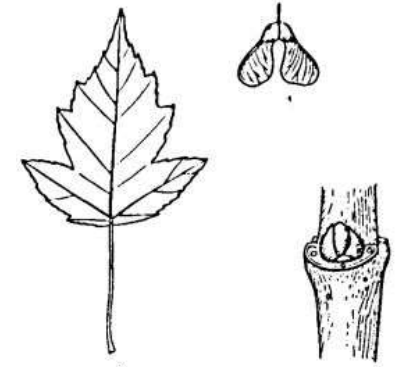

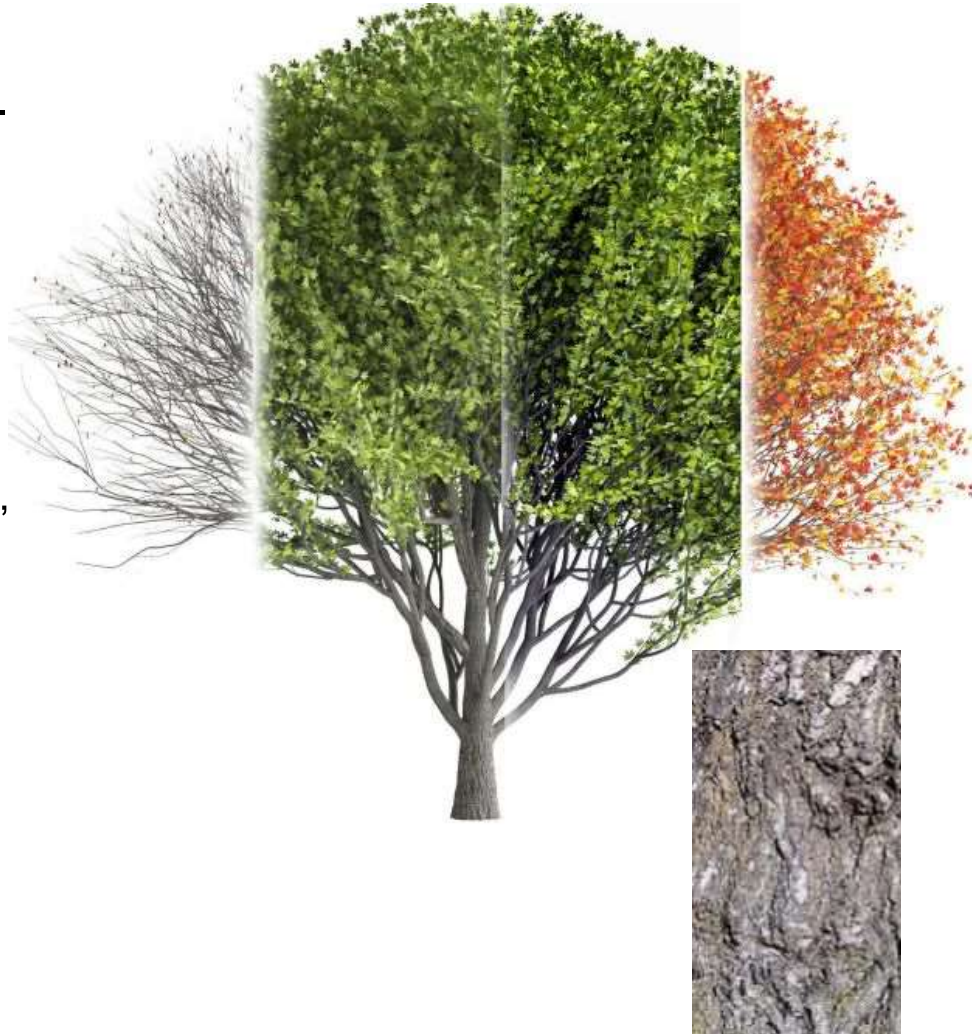

Érable ginnala

Amur Maple is a small deciduous tree or large shrub native to East Asia.

The foliage turns vibrant shades of red, orange, and yellow in the fall.

In spring, it produces small, fragrant flowers, then many winged seeds, known as samaras, which are dispersed by the wind.

Birds are attracted to its seeds, while butterflies and other pollinators visit its flowers.

Due to its invasiveness, Amur Maple may require management in some areas to prevent it from spreading uncontrollably.

This may include pruning, removal of seedlings, or replacement with non-invasive species in sensitive habitats.

*Amur Maple is an alien and possibly invasive species.*

*Acer ginnala*
